

# Analysis output: all-atom contacts and geometry for OTOF\_1-124\_WTH.pdb

## Summary statistics

|                   |   |          |  |              |
|-------------------|---|----------|--|--------------|
| All-Atom Contacts | Clashscore, all atoms:  | 8.52     | 79 <sup>th</sup> percentile* (N=1784, all resolutions) |              |
|                   | Clashscore is the number of serious steric overlaps (> 0.4 Å) per 1000 atoms. |          |  |              |
| Protein Geometry  | Poor rotamers   | 2        | 1.77%  | Goal: <1%    |
|                   | Ramachandran outliers   | 1        | 0.82%  | Goal: <0.05% |
|                   | Ramachandran favored  | 117      | 95.90%   | Goal: >98%   |
|                   | MolProbity score^   | 1.93     | 79 <sup>th</sup> percentile* (N=27675, 0Å - 99Å)       |              |
|                   | Cβ deviations >0.25Å  | 0        | 0.00%  | Goal: 0      |
|                   | Bad backbone bonds:   | 3 / 1013 | 0.30%  | Goal: 0%     |
|                   | Bad backbone angles:  | 1 / 1368 | 0.07%  | Goal: <0.1%  |

In the two column results, the left column gives the raw count, right column gives the percentage.

\* 100<sup>th</sup> percentile is the best among structures of comparable resolution; 0<sup>th</sup> percentile is the worst. For clashscore the comparative set of structures was selected in 2004, for MolProbity score in 2006.

<sup>^</sup> MolProbity score combines the clashscore, rotamer, and Ramachandran evaluations into a single score, normalized to be on the same scale as X-ray resolution.

By adding H to this model and allowing Asn/Gln/His flips, we could *automatically* improve your clashscore by 1 points.
